This species will go to flower after its second year of growth and produces a spiked inflorescence that is attractive to native pollinators such as bumblebees and butterflies. It is a robust plant that can thrive in full-sun and part-shade making it ideal for acclimating to whatever your yard has to offer.

This adorable plant is a woodland goldenrod that would do very well at colonizing an area of partial sun under a landscaped tree or other woody vegetation. It is a short statured and easy to manage plant with a beautiful yellow spiked bloom in the early fall. The namesake for this plant is due to the way the flowers zig and zag their way up the flowering stem. Our native bumblebees and butterflies regularly feed on the pollen and nectar from this species while in bloom!
